

#### **Active suckling in child development**

Proper suckling has a strong impact on health child development. By giving the Little One the breast we're in effect obligating him to quite a trying activity. It is a demanding activity (in particular for his lip and tongue muscles) resulting in independent drawing of food from the breast. During correct, active suckling the infant maintains the proper pattern of suckling-swallowing-breathing. While breast feeding or bottle feeding it is important to ensure the active suckling process. It has a direct impact on:

- proper swallowing (without dripping and choking)
- proper breathing (effective breathing through the nose)
- correct orthodontic development
- future speech development
- limiting effects of colic

#### **LOVI – reproducing the natural feeding**

Thanks to innovative, patented technology of heterogeneous silicone layers, LOVI dynamic teat® elongates like a mother's nipple and enables the infant to suckle actively. Helps to combine breast feeding with bottle feeding (fig. 1 dynamic teat). A uniquely shaped bottle not only indicates the appropriate way of holding, but also helps the bottle to move according to your baby's suction rhythm. (fig. 2 how to hold the bottle).

#### **LOVI- benefits for your baby**

**Active feeding** – the dynamic teat® and LOVI bottle have been designer in such a way to stimulate the baby to suckle actively Turing bottle feeding, Just as it takes place Turing bottle feeding, which in turn stimulates proper development of your baby's mouth.

**Proper breathing** – LOVI teat extracts correct lip positioning from the baby, which teaches the baby proper breathing through the nose.

**A healthy bite** – a wide and easy to grasp base of the LOVI teat works against biting the teat during feeding and supports proper and natural bite development as well as shapes a beautiful smile.

**Speech development** – according to recent pediatrics research, active feeding stimulates muscles responsible for speech development. The LOVI dynamic teat® provides an active training for these muscles, from the very first days of your baby's life.

**Anti-colic** – a unique air release system helps the teat to reduce colic at newborns.

**Set includes:**

LOVI 150ml/250ml bottle; silicone, dynamic teat® mini 0m+; soft sealing disk. (fig. 3 how to mount the soft sealing disc); screw cap - once the soft sealing disc and screw cap are mounted; the bottle becomes an ideal container for storing food in the refrigerator, during trips or long walks (fig. 4 tipped sealed container); hood with scale (does not apply to self - sterilizing bottles) - ideal for serving small amounts of milk, water, medicine or any other food.

**Instruction for use:**

Check the bottle and its all components before each use, pull the teat in all directions. Throw away at the first signs of damage or weakness. Never leave the teat exposed to the direct sunlight, high temperature or detergent for longer than recommended, as it can damage the teat. Before first and each use wash all parts of the bottle and the teat, than place in boiling water (for no longer than 5 min.). Boiling (for longer than recommended) and hard water may create lime scale effect. Remember not to screw on the cap too tight, otherwise the teat air release system might malfunction. Always check for leakage. After each use clean the bottle and teat from liquid remains, rinse and wash with hot water; do not boil. It is not recommended to place the bottle and teat in a dishwasher. Fruit juice or tea may leave stains on the bottle/teat, or create limescale effect which does not change their properties. For safety and hygienic reasons, as well as due to the increasing demand for food of your growing baby, it is recommended to replace the teat at least every 2 months. Available LOVI dynamic teats: mini 0m+; slow 3m+; medium 6m+; fast 9m+; cross - cut 6m+; variable 3m+ (see table).

**Warning! For your child's safety and health**

Always use this product under adult supervision. Do not use the teat as a soother. Continuous and prolonged suckling of fluids may cause tooth decay. Always check the food temperature before feeding. Do not enlarge the teat holes, this may cause damage of the teat or create choking hazard. Do not leave your baby unattended during feeding. Product is not a toy. Keep away from reach of children when not in use. Retain the instruction for later use. Batch code and expiry date for the teat is paced on the packaging.
